Verification of The SET Protocol

Giampaolo Bella, Fabio Massacci, Lawrence C. Paulson et al.

September 11, 2023

Contents

1 The Message Theory, Modified for SET **2**
1.1 General Lemmas 2
1.1.1 Inductive definition of all "parts" of a message. 3
1.1.2 Inverse of keys 3
1.2 keysFor operator 4
1.3 Inductive relation "parts" 5
1.3.1 Unions 5
1.3.2 Idempotence and transitivity 6
1.3.3 Rewrite rules for pulling out atomic messages 6
1.4 Inductive relation "analz" 7
1.4.1 General equational properties 8
1.4.2 Rewrite rules for pulling out atomic messages 8
1.4.3 Idempotence and transitivity 10
1.5 Inductive relation "synth" 11
1.5.1 Unions 11
1.5.2 Idempotence and transitivity 11
1.5.3 Combinations of parts, analz and synth 12
1.5.4 For reasoning about the Fake rule in traces 12
1.6 Tactics useful for many protocol proofs 14

2 Theory of Events for SET **14**
2.1 Agents' Knowledge 15
2.2 Used Messages 15
2.3 The Function *used* 17

3 The Public-Key Theory, Modified for SET **17**
3.1 Symmetric and Asymmetric Keys 18
3.2 Initial Knowledge 18
3.3 Signature Primitives 19
3.4 Encryption Primitives 19
3.5 Basic Properties of pubEK, pubSK, priEK and priSK 20
3.6 "Image" Equations That Hold for Injective Functions 21
3.7 Fresh Nonces for Possibility Theorems 22
3.8 Specialized Methods for Possibility Theorems 22
3.9 Specialized Rewriting for Theorems About *analz* and Image . . . 22
3.10 Controlled Unfolding of Abbreviations 23
3.10.1 Special Simplification Rules for *signCert* 23

3.10.2 Elimination Rules for Controlled Rewriting 24
3.11 Lemmas to Simplify Expressions Involving `analz` 24
3.12 Freshness Lemmas 24

4 The SET Cardholder Registration Protocol 25
4.1 Predicate Formalizing the Encryption Association between Keys 25
4.2 Predicate formalizing the association between keys and nonces . 25
4.3 Formal protocol definition 26
4.4 Proofs on keys 29
4.5 Begin Piero's Theorems on Certificates 29
4.6 New versions: as above, but generalized to have the KK argument 30
4.7 Useful lemmas 31
4.8 Secrecy of Session Keys 31
4.8.1 Lemmas about the predicate KeyCryptKey 31
4.9 Primary Goals of Cardholder Registration 32
4.10 Secrecy of Nonces 33
4.10.1 Lemmas about the predicate KeyCryptNonce 33
4.10.2 Lemmas for message 5 and 6: either cardSK is compromised (when we don't care) or else cardSK hasn't been used to encrypt K. 34
4.11 Secrecy of CardSecret: the Cardholder's secret 34
4.12 Secrecy of NonceCCA [the CA's secret] 35
4.13 Rewriting Rule for PANs 36
4.14 Unicity 37

5 The SET Merchant Registration Protocol 37
5.0.1 Proofs on keys 39
5.0.2 New Versions: As Above, but Generalized with the Kk Argument 40
5.1 Secrecy of Session Keys 41
5.2 Unicity 42
5.3 Primary Goals of Merchant Registration 43
5.3.1 The merchant's certificates really were created by the CA, provided the CA is uncompromised 43

6 Purchase Phase of SET 44
6.1 Possibility Properties 49
6.2 Proofs on Asymmetric Keys 50
6.3 Public Keys in Certificates are Correct 51
6.4 Proofs on Symmetric Keys 51
6.5 Secrecy of Symmetric Keys 52
6.6 Secrecy of Nonces 53
6.7 Confidentiality of PAN 53
6.8 Proofs Common to Signed and Unsigned Versions 54
6.9 Proofs for Unsigned Purchases 56
6.10 Proofs for Signed Purchases 57

1 The Message Theory, Modified for SET

```
theory Message_SET
imports Main "HOL-Library.Nat_Bijection"
begin
```

1.1 General Lemmas

Needed occasionally with `spy_analz_tac`, e.g. in `analz_insert_Key_newK`

```
lemma Un_absorb3 [simp] : "A ∪ (B ∪ A) = B ∪ A"
⟨proof⟩
```

Collapses redundant cases in the huge protocol proofs

```
lemmas disj_simps = disj_comms disj_left_absorb disj_assoc
```

Effective with assumptions like `K ∉ range pubK` and `K ∉ invKey ‘ range pubK`

```
lemma notin_image_iff: "(y ∉ f‘I) = (∀ i∈I. f i ≠ y)"
⟨proof⟩
```

Effective with the assumption `KK ⊆ - range (invKey ∘ pubK)`

```
lemma disjoint_image_iff: "(A ⊆ - (f‘I)) = (∀ i∈I. f i ∉ A)"
⟨proof⟩
```

```
type_synonym key = nat

consts
  all_symmetric :: bool          — true if all keys are symmetric
  invKey        :: "key⇒key"    — inverse of a symmetric key

specification (invKey)
  invKey [simp]: "invKey (invKey K) = K"
  invKey_symmetric: "all_symmetric ⟶ invKey = id"
    ⟨proof⟩
```

The inverse of a symmetric key is itself; that of a public key is the private key and vice versa

```
definition symKeys :: "key set" where
  "symKeys == {K. invKey K = K}"
```

Agents. We allow any number of certification authorities, cardholders merchants, and payment gateways.

```
datatype
  agent = CA nat | Cardholder nat | Merchant nat | PG nat | Spy
```

Messages

```
datatype
     msg = Agent  agent      — Agent names
         | Number nat        — Ordinary integers, timestamps, ...
         | Nonce  nat        — Unguessable nonces
```

```
| Pan    nat        — Unguessable Primary Account Numbers (??)
| Key    key        — Crypto keys
| Hash   msg        — Hashing
| MPair  msg msg    — Compound messages
| Crypt  key msg    — Encryption, public- or shared-key
```

```
syntax
  "_MTuple"      :: "['a, args] ⇒ 'a * 'b"       ("(2{|_,/ _|})")
translations
  "{|x, y, z|}"   == "{|x, {|y, z|}|}"
  "{|x, y|}"      == "CONST MPair x y"
```

```
definition nat_of_agent :: "agent ⇒ nat" where
   "nat_of_agent == case_agent (curry prod_encode 0)
                               (curry prod_encode 1)
                               (curry prod_encode 2)
                               (curry prod_encode 3)
                               (prod_encode (4,0))"
    — maps each agent to a unique natural number, for specifications
```

The function is indeed injective

```
lemma inj_nat_of_agent: "inj nat_of_agent"
⟨proof⟩
```

```
definition

  keysFor :: "msg set ⇒ key set"
  where "keysFor H = invKey ` {K. ∃X. Crypt K X ∈ H}"
```

1.1.1 Inductive definition of all "parts" of a message.

```
inductive_set
  parts :: "msg set ⇒ msg set"
  for H :: "msg set"
  where
    Inj [intro]:               "X ∈ H ==> X ∈ parts H"
  | Fst:         "{|X,Y|}   ∈ parts H ==> X ∈ parts H"
  | Snd:         "{|X,Y|}   ∈ parts H ==> Y ∈ parts H"
  | Body:        "Crypt K X ∈ parts H ==> X ∈ parts H"
```

```
lemma parts_mono: "G⊆H ==> parts(G) ⊆ parts(H)"
⟨proof⟩
```

1.1.2 Inverse of keys

```
lemma Key_image_eq [simp]: "(Key x ∈ Key`A) = (x∈A)"
⟨proof⟩
```

lemma *Nonce_Key_image_eq [simp]: "(Nonce x ∉ Key`A)"*
⟨*proof*⟩

lemma *Cardholder_image_eq [simp]: "(Cardholder x ∈ Cardholder`A) = (x ∈ A)"*
⟨*proof*⟩

lemma *CA_image_eq [simp]: "(CA x ∈ CA`A) = (x ∈ A)"*
⟨*proof*⟩

lemma *Pan_image_eq [simp]: "(Pan x ∈ Pan`A) = (x ∈ A)"*
⟨*proof*⟩

lemma *Pan_Key_image_eq [simp]: "(Pan x ∉ Key`A)"*
⟨*proof*⟩

lemma *Nonce_Pan_image_eq [simp]: "(Nonce x ∉ Pan`A)"*
⟨*proof*⟩

lemma *invKey_eq [simp]: "(invKey K = invKey K') = (K=K')"*
⟨*proof*⟩

1.2 keysFor operator

lemma *keysFor_empty [simp]: "keysFor {} = {}"*
⟨*proof*⟩

lemma *keysFor_Un [simp]: "keysFor (H ∪ H') = keysFor H ∪ keysFor H'"*
⟨*proof*⟩

lemma *keysFor_UN [simp]: "keysFor (⋃i∈A. H i) = (⋃i∈A. keysFor (H i))"*
⟨*proof*⟩

lemma *keysFor_mono: "G⊆H ==> keysFor(G) ⊆ keysFor(H)"*
⟨*proof*⟩

lemma *keysFor_insert_Agent [simp]: "keysFor (insert (Agent A) H) = keysFor H"*
⟨*proof*⟩

lemma *keysFor_insert_Nonce [simp]: "keysFor (insert (Nonce N) H) = keysFor H"*
⟨*proof*⟩

lemma *keysFor_insert_Number [simp]: "keysFor (insert (Number N) H) = keysFor H"*
⟨*proof*⟩

lemma *keysFor_insert_Key [simp]: "keysFor (insert (Key K) H) = keysFor H"*
⟨*proof*⟩

lemma *keysFor_insert_Pan [simp]: "keysFor (insert (Pan A) H) = keysFor H"*
⟨*proof*⟩

lemma *keysFor_insert_Hash [simp]: "keysFor (insert (Hash X) H) = keysFor H"*
⟨*proof*⟩

lemma *keysFor_insert_MPair [simp]: "keysFor (insert {|X,Y|} H) = keysFor H"*
⟨*proof*⟩

lemma *keysFor_insert_Crypt [simp]:*
"keysFor (insert (Crypt K X) H) = insert (invKey K) (keysFor H)"
⟨*proof*⟩

lemma *keysFor_image_Key [simp]: "keysFor (Key‘E) = {}"*
⟨*proof*⟩

lemma *Crypt_imp_invKey_keysFor: "Crypt K X ∈ H ==> invKey K ∈ keysFor H"*
⟨*proof*⟩

1.3 Inductive relation "parts"

lemma *MPair_parts:*
"[| {|X,Y|} ∈ parts H;
[| X ∈ parts H; Y ∈ parts H |] ==> P |] ==> P"
⟨*proof*⟩

declare *MPair_parts [elim!] parts.Body [dest!]*

NB These two rules are UNSAFE in the formal sense, as they discard the compound message. They work well on THIS FILE. *MPair_parts* is left as SAFE because it speeds up proofs. The Crypt rule is normally kept UNSAFE to avoid breaking up certificates.

lemma *parts_increasing: "H ⊆ parts(H)"*
⟨*proof*⟩

lemmas *parts_insertI = subset_insertI [THEN parts_mono, THEN subsetD]*

lemma *parts_empty [simp]: "parts{} = {}"*
⟨*proof*⟩

lemma *parts_emptyE [elim!]: "X∈ parts{} ==> P"*
⟨*proof*⟩

lemma *parts_singleton: "X∈ parts H ==> ∃ Y∈H. X∈ parts {Y}"*
⟨*proof*⟩

1.3.1 Unions

lemma *parts_Un_subset1: "parts(G) ∪ parts(H) ⊆ parts(G ∪ H)"*
⟨*proof*⟩

lemma *parts_Un_subset2: "parts(G ∪ H) ⊆ parts(G) ∪ parts(H)"*
⟨*proof*⟩

lemma *parts_Un [simp]: "parts(G ∪ H) = parts(G) ∪ parts(H)"*
⟨*proof*⟩

lemma *parts_insert: "parts (insert X H) = parts {X} ∪ parts H"*
⟨*proof*⟩

lemma *parts_insert2:*
"parts (insert X (insert Y H)) = parts {X} ∪ parts {Y} ∪ parts H"
⟨*proof*⟩

This allows `blast` to simplify occurrences of *parts (G ∪ H)* in the assumption.

declare *parts_Un [THEN equalityD1, THEN subsetD, THEN UnE, elim!]*

lemma *parts_insert_subset: "insert X (parts H) ⊆ parts(insert X H)"*
⟨*proof*⟩

1.3.2 Idempotence and transitivity

lemma *parts_partsD [dest!]: "X∈ parts (parts H) ==> X∈ parts H"*
⟨*proof*⟩

lemma *parts_idem [simp]: "parts (parts H) = parts H"*
⟨*proof*⟩

lemma *parts_trans: "[| X∈ parts G; G ⊆ parts H |] ==> X∈ parts H"*
⟨*proof*⟩

lemma *parts_cut:*
"[| Y∈ parts (insert X G); X∈ parts H |] ==> Y∈ parts (G ∪ H)"
⟨*proof*⟩

lemma *parts_cut_eq [simp]: "X∈ parts H ==> parts (insert X H) = parts H"*
⟨*proof*⟩

1.3.3 Rewrite rules for pulling out atomic messages

lemmas *parts_insert_eq_I = equalityI [OF subsetI parts_insert_subset]*

lemma *parts_insert_Agent [simp]:*
"parts (insert (Agent agt) H) = insert (Agent agt) (parts H)"
⟨*proof*⟩

lemma *parts_insert_Nonce [simp]:*
"parts (insert (Nonce N) H) = insert (Nonce N) (parts H)"
⟨*proof*⟩

lemma *parts_insert_Number [simp]:*
"parts (insert (Number N) H) = insert (Number N) (parts H)"
⟨*proof*⟩

```
lemma parts_insert_Key [simp]:
     "parts (insert (Key K) H) = insert (Key K) (parts H)"
⟨proof⟩

lemma parts_insert_Pan [simp]:
     "parts (insert (Pan A) H) = insert (Pan A) (parts H)"
⟨proof⟩

lemma parts_insert_Hash [simp]:
     "parts (insert (Hash X) H) = insert (Hash X) (parts H)"
⟨proof⟩

lemma parts_insert_Crypt [simp]:
     "parts (insert (Crypt K X) H) =
          insert (Crypt K X) (parts (insert X H))"
⟨proof⟩

lemma parts_insert_MPair [simp]:
     "parts (insert {|X,Y|} H) =
          insert {|X,Y|} (parts (insert X (insert Y H)))"
⟨proof⟩

lemma parts_image_Key [simp]: "parts (Key`N) = Key`N"
⟨proof⟩

lemma parts_image_Pan [simp]: "parts (Pan`A) = Pan`A"
⟨proof⟩

lemma msg_Nonce_supply: "∃N. ∀n. N≤n ⟶ Nonce n ∉ parts {msg}"
⟨proof⟩

lemma msg_Number_supply: "∃N. ∀n. N≤n ⟶ Number n ∉ parts {msg}"
⟨proof⟩
```

1.4 Inductive relation "analz"

Inductive definition of "analz" – what can be broken down from a set of messages, including keys. A form of downward closure. Pairs can be taken apart; messages decrypted with known keys.

```
inductive_set
  analz :: "msg set => msg set"
  for H :: "msg set"
  where
    Inj [intro,simp] :    "X ∈ H ==> X ∈ analz H"
  | Fst:     "{|X,Y|} ∈ analz H ==> X ∈ analz H"
  | Snd:     "{|X,Y|} ∈ analz H ==> Y ∈ analz H"
  | Decrypt [dest]:
             "[|Crypt K X ∈ analz H; Key(invKey K) ∈ analz H|] ==> X ∈ analz
H"
```

lemma *analz_mono: "G⊆H ==> analz(G) ⊆ analz(H)"*
⟨*proof*⟩

Making it safe speeds up proofs

lemma *MPair_analz [elim!]:*
```
     "[| {|X,Y|} ∈ analz H;
             [| X ∈ analz H; Y ∈ analz H |] ==> P
          |] ==> P"
```
⟨*proof*⟩

lemma *analz_increasing: "H ⊆ analz(H)"*
⟨*proof*⟩

lemma *analz_subset_parts: "analz H ⊆ parts H"*
⟨*proof*⟩

lemmas *analz_into_parts = analz_subset_parts [THEN subsetD]*

lemmas *not_parts_not_analz = analz_subset_parts [THEN contra_subsetD]*

lemma *parts_analz [simp]: "parts (analz H) = parts H"*
⟨*proof*⟩

lemma *analz_parts [simp]: "analz (parts H) = parts H"*
⟨*proof*⟩

lemmas *analz_insertI = subset_insertI [THEN analz_mono, THEN [2] rev_subsetD]*

1.4.1 General equational properties

lemma *analz_empty [simp]: "analz{} = {}"*
⟨*proof*⟩

lemma *analz_Un: "analz(G) ∪ analz(H) ⊆ analz(G ∪ H)"*
⟨*proof*⟩

lemma *analz_insert: "insert X (analz H) ⊆ analz(insert X H)"*
⟨*proof*⟩

1.4.2 Rewrite rules for pulling out atomic messages

lemmas *analz_insert_eq_I = equalityI [OF subsetI analz_insert]*

lemma *analz_insert_Agent [simp]:*
```
     "analz (insert (Agent agt) H) = insert (Agent agt) (analz H)"
```
⟨*proof*⟩

lemma *analz_insert_Nonce [simp]:*
```
     "analz (insert (Nonce N) H) = insert (Nonce N) (analz H)"
```
⟨*proof*⟩

lemma *analz_insert_Number [simp]:*
```
"analz (insert (Number N) H) = insert (Number N) (analz H)"
```
⟨*proof*⟩

lemma *analz_insert_Hash [simp]:*
```
"analz (insert (Hash X) H) = insert (Hash X) (analz H)"
```
⟨*proof*⟩

lemma *analz_insert_Key [simp]:*
```
"K ∉ keysFor (analz H) ==>
      analz (insert (Key K) H) = insert (Key K) (analz H)"
```
⟨*proof*⟩

lemma *analz_insert_MPair [simp]:*
```
"analz (insert {|X,Y|} H) =
      insert {|X,Y|} (analz (insert X (insert Y H)))"
```
⟨*proof*⟩

lemma *analz_insert_Crypt:*
```
"Key (invKey K) ∉ analz H
 ==> analz (insert (Crypt K X) H) = insert (Crypt K X) (analz H)"
```
⟨*proof*⟩

lemma *analz_insert_Pan [simp]:*
```
"analz (insert (Pan A) H) = insert (Pan A) (analz H)"
```
⟨*proof*⟩

lemma *lemma1:*
```
"Key (invKey K) ∈ analz H ==>
        analz (insert (Crypt K X) H) ⊆
        insert (Crypt K X) (analz (insert X H))"
```
⟨*proof*⟩

lemma *lemma2:*
```
"Key (invKey K) ∈ analz H ==>
        insert (Crypt K X) (analz (insert X H)) ⊆
        analz (insert (Crypt K X) H)"
```
⟨*proof*⟩

lemma *analz_insert_Decrypt:*
```
"Key (invKey K) ∈ analz H ==>
          analz (insert (Crypt K X) H) =
          insert (Crypt K X) (analz (insert X H))"
```
⟨*proof*⟩

lemma *analz_Crypt_if [simp]:*
```
"analz (insert (Crypt K X) H) =
      (if (Key (invKey K) ∈ analz H)
       then insert (Crypt K X) (analz (insert X H))
       else insert (Crypt K X) (analz H))"
```
⟨*proof*⟩

lemma *analz_insert_Crypt_subset:*
```
"analz (insert (Crypt K X) H) ⊆
      insert (Crypt K X) (analz (insert X H))"
```
⟨*proof*⟩

lemma *analz_image_Key [simp]: "analz (Key‘N) = Key‘N"*
⟨*proof*⟩

lemma *analz_image_Pan [simp]: "analz (Pan‘A) = Pan‘A"*
⟨*proof*⟩

1.4.3 Idempotence and transitivity

lemma *analz_analzD [dest!]: "X∈ analz (analz H) ==> X∈ analz H"*
⟨*proof*⟩

lemma *analz_idem [simp]: "analz (analz H) = analz H"*
⟨*proof*⟩

lemma *analz_trans: "[| X∈ analz G; G ⊆ analz H |] ==> X∈ analz H"*
⟨*proof*⟩

lemma *analz_cut: "[| Y∈ analz (insert X H); X∈ analz H |] ==> Y∈ analz H"*
⟨*proof*⟩

lemma *analz_insert_eq: "X∈ analz H ==> analz (insert X H) = analz H"*
⟨*proof*⟩

A congruence rule for "analz"

lemma *analz_subset_cong:*
```
"[| analz G ⊆ analz G'; analz H ⊆ analz H'
         |] ==> analz (G ∪ H) ⊆ analz (G' ∪ H')"
```
⟨*proof*⟩

lemma *analz_cong:*
```
"[| analz G = analz G'; analz H = analz H'
         |] ==> analz (G ∪ H) = analz (G' ∪ H')"
```
⟨*proof*⟩

lemma *analz_insert_cong:*
```
"analz H = analz H' ==> analz(insert X H) = analz(insert X H')"
```
⟨*proof*⟩

lemma *analz_trivial:*
```
"[| ∀X Y. {|X,Y|} ∉ H;  ∀X K. Crypt K X ∉ H |] ==> analz H = H"
```
⟨*proof*⟩

1.5 Inductive relation "synth"

Inductive definition of "synth" – what can be built up from a set of messages. A form of upward closure. Pairs can be built, messages encrypted with known keys. Agent names are public domain. Numbers can be guessed, but Nonces cannot be.

```
inductive_set
  synth :: "msg set ⇒ msg set"
  for H :: "msg set"
  where
    Inj    [intro]:   "X ∈ H ==> X ∈ synth H"
  | Agent  [intro]:   "Agent agt ∈ synth H"
  | Number [intro]:   "Number n  ∈ synth H"
  | Hash   [intro]:   "X ∈ synth H ==> Hash X ∈ synth H"
  | MPair  [intro]:   "[|X ∈ synth H;  Y ∈ synth H|] ==> {|X,Y|} ∈ synth H"
  | Crypt  [intro]:   "[|X ∈ synth H;  Key(K) ∈ H|] ==> Crypt K X ∈ synth
H"
```

```
lemma synth_mono: "G⊆H ==> synth(G) ⊆ synth(H)"
⟨proof⟩
```

```
inductive_cases Nonce_synth [elim!]: "Nonce n ∈ synth H"
inductive_cases Key_synth   [elim!]: "Key K ∈ synth H"
inductive_cases Hash_synth  [elim!]: "Hash X ∈ synth H"
inductive_cases MPair_synth [elim!]: "{|X,Y|} ∈ synth H"
inductive_cases Crypt_synth [elim!]: "Crypt K X ∈ synth H"
inductive_cases Pan_synth   [elim!]: "Pan A ∈ synth H"
```

```
lemma synth_increasing: "H ⊆ synth(H)"
⟨proof⟩
```

1.5.1 Unions

```
lemma synth_Un: "synth(G) ∪ synth(H) ⊆ synth(G ∪ H)"
⟨proof⟩

lemma synth_insert: "insert X (synth H) ⊆ synth(insert X H)"
⟨proof⟩
```

1.5.2 Idempotence and transitivity

```
lemma synth_synthD [dest!]: "X∈ synth (synth H) ==> X∈ synth H"
⟨proof⟩

lemma synth_idem: "synth (synth H) = synth H"
⟨proof⟩

lemma synth_trans: "[| X∈ synth G;  G ⊆ synth H |] ==> X∈ synth H"
⟨proof⟩
```

lemma *synth_cut: "[| Y∈ synth (insert X H); X∈ synth H |] ==> Y∈ synth H"*
⟨*proof*⟩

lemma *Agent_synth [simp]: "Agent A ∈ synth H"*
⟨*proof*⟩

lemma *Number_synth [simp]: "Number n ∈ synth H"*
⟨*proof*⟩

lemma *Nonce_synth_eq [simp]: "(Nonce N ∈ synth H) = (Nonce N ∈ H)"*
⟨*proof*⟩

lemma *Key_synth_eq [simp]: "(Key K ∈ synth H) = (Key K ∈ H)"*
⟨*proof*⟩

lemma *Crypt_synth_eq [simp]: "Key K ∉ H ==> (Crypt K X ∈ synth H) = (Crypt K X ∈ H)"*
⟨*proof*⟩

lemma *Pan_synth_eq [simp]: "(Pan A ∈ synth H) = (Pan A ∈ H)"*
⟨*proof*⟩

lemma *keysFor_synth [simp]:*
"keysFor (synth H) = keysFor H ∪ invKey‘{K. Key K ∈ H}"
⟨*proof*⟩

1.5.3 Combinations of parts, analz and synth

lemma *parts_synth [simp]: "parts (synth H) = parts H ∪ synth H"*
⟨*proof*⟩

lemma *analz_analz_Un [simp]: "analz (analz G ∪ H) = analz (G ∪ H)"*
⟨*proof*⟩

lemma *analz_synth_Un [simp]: "analz (synth G ∪ H) = analz (G ∪ H) ∪ synth G"*
⟨*proof*⟩

lemma *analz_synth [simp]: "analz (synth H) = analz H ∪ synth H"*
⟨*proof*⟩

1.5.4 For reasoning about the Fake rule in traces

lemma *parts_insert_subset_Un: "X∈ G ==> parts(insert X H) ⊆ parts G ∪ parts H"*
⟨*proof*⟩

lemma *Fake_parts_insert: "X ∈ synth (analz H) ==>*
parts (insert X H) ⊆ synth (analz H) ∪ parts H"
⟨*proof*⟩

lemma *Fake_parts_insert_in_Un:*
"[|Z ∈ parts (insert X H); X ∈ synth (analz H)|]

```
      ==> Z ∈  synth (analz H) ∪ parts H"
⟨proof⟩
```

lemma *Fake_analz_insert:*
```

⟨*ML*⟩

end

3 The Public-Key Theory, Modified for SET

theory *Public_SET*
imports *Event_SET*
begin

3.1 Symmetric and Asymmetric Keys

definitions influenced by the wish to assign asymmetric keys - since the beginning - only to RCA and CAs, namely we need a partial function on type Agent

The SET specs mention two signature keys for CAs - we only have one

```
consts
  publicKey :: "[bool, agent] ⇒ key"
    — the boolean is TRUE if a signing key

abbreviation "pubEK == publicKey False"
abbreviation "pubSK == publicKey True"

abbreviation "priEK A == invKey (pubEK A)"
abbreviation "priSK A == invKey (pubSK A)"
```

By freeness of agents, no two agents have the same key. Since `True ≠ False`, no agent has the same signing and encryption keys.

```
specification (publicKey)
  injective_publicKey:
    "publicKey b A = publicKey c A' ⟹ b=c ∧ A=A'"⟨proof⟩
axiomatization where

  privateKey_neq_publicKey [iff]:
      "invKey (publicKey b A) ≠ publicKey b' A'"

declare privateKey_neq_publicKey [THEN not_sym, iff]
```

3.2 Initial Knowledge

This information is not necessary. Each protocol distributes any needed certificates, and anyway our proofs require a formalization of the Spy's knowledge only. However, the initial knowledge is as follows: All agents know RCA's public keys; RCA and CAs know their own respective keys; RCA (has already certified and therefore) knows all CAs public keys; Spy knows all keys of all bad agents.

```
overloading initState ≡ "initState"
begin

primrec initState where| initState_Spy:
    "initState Spy = Key ‘ (invKey ‘ pubEK ‘ bad ∪
                            invKey ‘ pubSK ‘ bad ∪
                            range pubEK ∪ range pubSK)"

end
```

Injective mapping from agents to PANs: an agent can have only one card

```
consts  pan :: "agent ⇒ nat"

specification (pan)
  inj_pan: "inj pan"
  — No two agents have the same PAN⟨proof⟩
```

```
declare inj_pan [THEN inj_eq, iff]

consts
  XOR :: "nat*nat ⇒ nat"  — no properties are assumed of exclusive-or
```

3.3 Signature Primitives

```
definition

  sign :: "[key, msg]⇒msg"
  where "sign K X = {|X, Crypt K (Hash X) |}"

definition

  signOnly :: "[key, msg]⇒msg"
  where "signOnly K X = Crypt K (Hash X)"

definition

  signCert :: "[key, msg]⇒msg"
  where "signCert K X = {|X, Crypt K X |}"

definition

  cert :: "[agent, key, msg, key] ⇒ msg"
  where "cert A Ka T signK = signCert signK {|Agent A, Key Ka, T|}"

definition

  certC :: "[nat, key, nat, msg, key] ⇒ msg"
  where "certC PAN Ka PS T signK =
    signCert signK {|Hash {|Nonce PS, Pan PAN|}, Key Ka, T|}"

abbreviation "onlyEnc == Number 0"
abbreviation "onlySig == Number (Suc 0)"
abbreviation "authCode == Number (Suc (Suc 0))"
```

3.4 Encryption Primitives

```
definition EXcrypt :: "[key,key,msg,msg] ⇒ msg" where
  — Extra Encryption

    "EXcrypt K EK M m =
       {|Crypt K {|M, Hash m|}, Crypt EK {|Key K, m|}|}"

definition EXHcrypt :: "[key,key,msg,msg] ⇒ msg" where
  — Extra Encryption with Hashing

    "EXHcrypt K EK M m =
       {|Crypt K {|M, Hash m|}, Crypt EK {|Key K, m, Hash M|}|}"

definition Enc :: "[key,key,key,msg] ⇒ msg" where
```

— Simple Encapsulation with SIGNATURE

```
"Enc SK K EK M =
   {|Crypt K (sign SK M), Crypt EK (Key K)|}"
```

definition *EncB :: "[key,key,key,msg,msg] ⇒ msg"* **where**
— Encapsulation with Baggage. Keys as above, and baggage b.

```
"EncB SK K EK M b =
   {|Enc SK K EK {|M, Hash b|}, b|}"
```

3.5 Basic Properties of pubEK, pubSK, priEK and priSK

lemma *publicKey_eq_iff [iff]:*

```
"(publicKey b A = publicKey b' A') = (b=b' ∧ A=A')"
```

⟨*proof*⟩

lemma *privateKey_eq_iff [iff]:*

```

     "publicKey b A ∉ invKey ` publicKey c ` AS"
⟨proof⟩

lemma keysFor_parts_initState [simp]: "keysFor (parts (initState C)) = {}"
⟨proof⟩
```

for proving `new_keys_not_used`

```
lemma keysFor_parts_insert:
     "[| K ∈ keysFor (parts (insert X H));  X ∈ synth (analz H) |]
      ==> K ∈ keysFor (parts H) | Key (invKey K) ∈ parts H"
⟨proof⟩

lemma Crypt_imp_keysFor [intro]:
     "[|K ∈ symKeys; Crypt K X ∈ H|] ==> K ∈ keysFor H"
⟨proof⟩
```

Agents see their own private keys!

```
lemma privateKey_in_initStateCA [iff]:
     "Key (invKey (publicKey b A)) ∈ initState A"
⟨proof⟩
```

Agents see their own public keys!

```
lemma publicKey_in_initStateCA [iff]: "Key (publicKey b A) ∈ initState A"
⟨proof⟩
```

RCA sees CAs' public keys!

```
lemma pubK_CA_in_initState_RCA [iff]:
     "Key (publicKey b (CA i)) ∈ initState RCA"
⟨proof⟩
```

Spy knows all public keys

```
lemma knows_Spy_pubEK_i [iff]: "Key (publicKey b A) ∈ knows Spy evs"
⟨proof⟩
```

declare *knows_Spy_pubEK_i [THEN analz.Inj, iff]*

Spy sees private keys of bad agents! [and obviously public keys too]

lemma *knows_Spy_bad_privateKey [intro!]:*
"A ∈ bad ⟹ Key (invKey (publicKey b A)) ∈ knows Spy evs"
⟨*proof*⟩

3.7 Fresh Nonces for Possibility Theorems

lemma *Nonce_notin_initState [iff]: "Nonce N ∉ parts (initState B)"*
⟨*proof*⟩

lemma *Nonce_notin_used_empty [simp]: "Nonce N ∉ used []"*
⟨*proof*⟩

In any trace, there is an upper bound N on the greatest nonce in use.

lemma *Nonce_supply_lemma: "∃N. ∀n. N≤n ⟶ Nonce n ∉ used evs"*
⟨*proof*⟩

lemma *Nonce_supply1: "∃N. Nonce N ∉ used evs"*
⟨*proof*⟩

lemma *Nonce_supply: "Nonce (SOME N. Nonce N ∉ used evs) ∉ used evs"*
⟨*proof*⟩

3.8 Specialized Methods for Possibility Theorems

⟨*ML*⟩

3.9 Specialized Rewriting for Theorems About *analz* and Image

lemma *insert_Key_singleton: "insert (Key K) H = Key ‘ {K} ∪ H"*
⟨*proof*⟩

lemma *insert_Key_image:*
"insert (Key K) (Key‘KK ∪ C) = Key ‘ (insert K KK) ∪ C"
⟨*proof*⟩

Needed for *DK_fresh_not_KeyCryptKey*

lemma *publicKey_in_used [iff]: "Key (publicKey b A) ∈ used evs"*
⟨*proof*⟩

lemma *privateKey_in_used [iff]: "Key (invKey (publicKey b A)) ∈ used evs"*
⟨*proof*⟩

Reverse the normal simplification of "image" to build up (not break down) the set of keys. Based on *analz_image_freshK_ss*, but simpler.

lemmas *analz_image_keys_simps =*
simp_thms mem_simps — these two allow its use with *only:*
image_insert [THEN sym] image_Un [THEN sym]
rangeI symKeys_neq_imp_neq
insert_Key_singleton insert_Key_image Un_assoc [THEN sym]

3.10 Controlled Unfolding of Abbreviations

A set is expanded only if a relation is applied to it

```
lemma def_abbrev_simp_relation:
     "A = B ⟹ (A ∈ X) = (B ∈ X) ∧
               (u = A) = (u = B) ∧
               (A = u) = (B = u)"
⟨proof⟩
```

A set is expanded only if one of the given functions is applied to it

```
lemma def_abbrev_simp_function:
     "A = B
      ⟹ parts (insert A X) = parts (insert B X) ∧
          analz (insert A X) = analz (insert B X) ∧
          keysFor (insert A X) = keysFor (insert B X)"
⟨proof⟩
```

3.10.1 Special Simplification Rules for *signCert*

Avoids duplicating X and its components!

```
lemma parts_insert_signCert:
     "parts (insert (signCert K X) H) =
      insert ⦃X, Crypt K X⦄ (parts (insert (Crypt K X) H))"
⟨proof⟩
```

Avoids a case split! [X is always available]

```
lemma analz_insert_signCert:
     "analz (insert (signCert K X) H) =
      insert ⦃X, Crypt K X⦄ (insert (Crypt K X) (analz (insert X H)))"
⟨proof⟩
```

```
lemma keysFor_insert_signCert: "keysFor (insert (signCert K X) H) = keysFor
H"
⟨proof⟩
```

Controlled rewrite rules for *signCert*, just the definitions of the others. Encryption primitives are just expanded, despite their huge redundancy!

```
lemmas abbrev_simps [simp] =
    parts_insert_signCert analz_insert_signCert keysFor_insert_signCert
    sign_def     [THEN def_abbrev_simp_relation]

3.10.2 Elimination Rules for Controlled Rewriting

lemma *Enc_partsE:*
```
"!!R. [|Enc SK K EK M ∈ parts H;
        [|Crypt K (sign SK M) ∈ parts H;
          Crypt EK (Key K) ∈ parts H|] ==> R|]
      ==> R"
```

⟨*proof*⟩

lemma *EncB_partsE:*
```
"!!R. [|EncB SK K EK M b ∈ parts H;
        [|Crypt K (sign SK {|M, Hash b|}) ∈ parts H;
          Crypt EK (Key K) ∈ parts H;
          b ∈ parts H|] ==> R|]
      ==> R"
```
⟨*proof*⟩

lemma *EXcrypt_partsE:*
```
"!!R. [|EXcrypt K EK M m ∈ parts H;
        [|Crypt K {|M, Hash m|} ∈ parts H;
          Crypt EK {|Key K, m|} ∈ parts H|] ==> R|]
      ==> R"
```
⟨*proof*⟩

3.11 Lemmas to Simplify Expressions Involving *analz*

lemma *analz_knows_absorb:*
```
"Key K ∈ analz (knows Spy evs)
 ==> analz (Key ` (insert K H) ∪ knows Spy evs) =
     analz (Key ` H ∪ knows Spy evs)"
```
⟨*proof*⟩

lemma *analz_knows_absorb2:*
```
"Key K ∈ analz (knows Spy evs)
 ==> analz (Key ` (insert X (insert K H)) ∪ knows Spy evs) =
     analz (Key ` (insert X H) ∪ knows Spy evs)"
```
⟨*proof*⟩

lemma *analz_insert_subset_eq:*
```
"[|X ∈ analz (knows Spy evs);  knows Spy evs ⊆ H|]
 ==> analz (insert X H) = analz H"
```
⟨*proof*⟩

lemmas *analz_insert_simps =*
```
    analz_insert_subset_eq Un_upper2
    subset_insertI [THEN [2] subset_trans]
```

3.12 Freshness Lemmas

lemma *in_parts_Says_imp_used:*

```
"[|Key K ∈ parts {X}; Says A B X ∈ set evs|] ==> Key K ∈ used evs"
```
⟨*proof*⟩

A useful rewrite rule with `analz_image_keys_simps`

lemma *Crypt_notin_image_Key: "Crypt K X ∉ Key ‘ KK"*
⟨*proof*⟩

lemma *fresh_notin_analz_knows_Spy:*
```
"Key K ∉ used evs ⟹ Key K ∉ analz (knows Spy evs)"
```
⟨*proof*⟩

end

4 The SET Cardholder Registration Protocol

theory *Cardholder_Registration*
imports *Public_SET*
begin

Note: nonces seem to consist of 20 bytes. That includes both freshness challenges (Chall-EE, etc.) and important secrets (CardSecret, PANsecret)

Simplifications involving `analz_image_keys_simps` appear to have become much slower. The cause is unclear. However, there is a big blow-up and the rewriting is very sensitive to the set of rewrite rules given.

4.1 Predicate Formalizing the Encryption Association between Keys

primrec *KeyCryptKey :: "[key, key, event list] ⇒ bool"*
where
```
  KeyCryptKey_Nil:
    "KeyCryptKey DK K [] = False"
| KeyCryptKey_Cons:
```
— Says is the only important case. 1st case: CR5, where KC3 encrypts KC2. 2nd case: any use of priEK C. Revision 1.12 has a more complicated version with separate treatment of the dependency of KC1, KC2 and KC3 on priEK (CA i.) Not needed since priEK C is never sent (and so can’t be lost except at the start).
```
    "KeyCryptKey DK K (ev # evs) =
     (KeyCryptKey DK K evs |
      (case ev of
        Says A B Z ⇒
         ((∃N X Y. A ≠ Spy ∧
                 DK ∈ symKeys ∧
                 Z = {|Crypt DK {|Agent A, Nonce N, Key K, X|}, Y|}) |
          (∃C. DK = priEK C))
       | Gets A' X ⇒ False
       | Notes A' X ⇒ False))"
```

4.2 Predicate formalizing the association between keys and nonces

primrec *KeyCryptNonce :: "[key, key, event list] ⇒ bool"*

where
```
  KeyCryptNonce_Nil:
    "KeyCryptNonce EK K [] = False"
| KeyCryptNonce_Cons:
```
— Says is the only important case. 1st case: CR3, where KC1 encrypts NC2 (distinct from CR5 due to EXH); 2nd case: CR5, where KC3 encrypts NC3; 3rd case: CR6, where KC2 encrypts NC3; 4th case: CR6, where KC2 encrypts NonceCCA; 5th case: any use of `priEK C` (including CardSecret). NB the only Nonces we need to keep secret are CardSecret and NonceCCA. But we can't prove `Nonce_compromise` unless the relation covers ALL nonces that the protocol keeps secret.
```
  "KeyCryptNonce DK N (ev # evs) =
   (KeyCryptNonce DK N evs |
    (case ev of
      Says A B Z ⇒
       A ≠ Spy ∧
       ((∃X Y. DK ∈ symKeys ∧
               Z = (EXHcrypt DK X {|Agent A, Nonce N|} Y)) |
        (∃X Y. DK ∈ symKeys ∧
               Z = {|Crypt DK {|Agent A, Nonce N, X|}, Y|}) |
        (∃K i X Y.
          K ∈ symKeys ∧
          Z = Crypt K {|sign (priSK (CA i)) {|Agent B, Nonce N, X|}, Y|} ∧
          (DK=K | KeyCryptKey DK K evs)) |
        (∃K C NC3 Y.
          K ∈ symKeys ∧
          Z = Crypt K
                {|sign (priSK C) {|Agent B, Nonce NC3, Agent C, Nonce N|},
                  Y|} ∧
          (DK=K | KeyCryptKey DK K evs)) |
        (∃C. DK = priEK C))
    | Gets A' X ⇒ False
    | Notes A' X ⇒ False))"
```

4.3 Formal protocol definition

inductive_set
```
  set_cr :: "event list set"
```
where

```
  Nil:
```
— Initial trace is empty
```
         "[] ∈ set_cr"
```

```
| Fake:
```
— The spy MAY say anything he CAN say.
```
          "[| evsf ∈ set_cr; X ∈ synth (analz (knows Spy evsf)) |]
           ==> Says Spy B X  # evsf ∈ set_cr"
```

```
| Reception:
```
— If A sends a message X to B, then B might receive it
```
             "[| evsr ∈ set_cr; Says A B X ∈ set evsr |]
              ==> Gets B X  # evsr ∈ set_cr"
```

```
| SET_CR1:
```
— CardCInitReq: C initiates a run, sending a nonce to CCA
```
             "[| evs1 ∈ set_cr;  C = Cardholder k;  Nonce NC1 ∉ used evs1
|]
              ==> Says C (CA i) {|Agent C, Nonce NC1|} # evs1 ∈ set_cr"
```

```
| SET_CR2: — CardCInitRes: CA responds sending NC1 and its certificates
            "[| evs2 ∈ set_cr;
                Gets (CA i) {|Agent C, Nonce NC1|} ∈ set evs2 |]
             ==> Says (CA i) C
                         {|sign (priSK (CA i)) {|Agent C, Nonce NC1|},
                           cert (CA i) (pubEK (CA i)) onlyEnc (priSK RCA),
                           cert (CA i) (pubSK (CA i)) onlySig (priSK RCA)|}
                   # evs2 ∈ set_cr"

| SET_CR3:
```

— RegFormReq: C sends his PAN and a new nonce to CA. C verifies that - nonce received is the same as that sent; - certificates are signed by RCA; - certificates are an encryption certificate (flag is onlyEnc) and a signature certificate (flag is onlySig); - certificates pertain to the CA that C contacted (this is done by checking the signature). C generates a fresh symmetric key KC1. The point of encrypting `{|Agent C, Nonce NC2, Hash (Pan (pan C))|}` is not clear.

```
"[| evs3 ∈ set_cr;  C = Cardholder k;
    Nonce NC2 ∉ used evs3;
    Key KC1 ∉ used evs3; KC1 ∈ symKeys;
    Gets C {|sign (invKey SKi) {|Agent X, Nonce NC1|},
             cert (CA i) EKi onlyEnc (priSK RCA),
             cert (CA i) SKi onlySig (priSK RCA)|}
       ∈ set evs3;
    Says C (CA i) {|Agent C, Nonce NC1|} ∈ set evs3|]
 ==> Says C (CA i) (EXHcrypt KC1 EKi {|Agent C, Nonce NC2|} (Pan(pan C)))
       # Notes C {|Key KC1, Agent (CA i)|}
       # evs3 ∈ set_cr"

| SET_CR4:
```

— RegFormRes: CA responds sending NC2 back with a new nonce NCA, after checking that - the digital envelope is correctly encrypted by `pubEK (CA i)` - the entire message is encrypted with the same key found inside the envelope (here, KC1)

```
"[| evs4 ∈ set_cr;
    Nonce NCA ∉ used evs4;  KC1 ∈ symKeys;
    Gets (CA i) (EXHcrypt KC1 EKi {|Agent C, Nonce NC2|} (Pan(pan X)))
       ∈ set evs4 |]
  ==> Says (CA i) C
          {|sign (priSK (CA i)) {|Agent C, Nonce NC2, Nonce NCA|},
            cert (CA i) (pubEK (CA i)) onlyEnc (priSK RCA),
            cert (CA i) (pubSK (CA i)) onlySig (priSK RCA)|}
       # evs4 ∈ set_cr"

| SET_CR5:
```

— CertReq: C sends his PAN, a new nonce, its proposed public signature key and its half of the secret value to CA. We now assume that C has a fixed key pair, and he submits (pubSK C). The protocol does not require this key to be fresh. The encryption below is actually EncX.

```
"[| evs5 ∈ set_cr;  C = Cardholder k;
    Nonce NC3 ∉ used evs5;  Nonce CardSecret ∉ used evs5; NC3≠CardSecret;
    Key KC2 ∉ used evs5; KC2 ∈ symKeys;
    Key KC3 ∉ used evs5; KC3 ∈ symKeys; KC2≠KC3;
    Gets C {|sign (invKey SKi) {|Agent C, Nonce NC2, Nonce NCA|},
             cert (CA i) EKi onlyEnc (priSK RCA),
```

```
            cert (CA i) SKi onlySig (priSK RCA) ⦄
        ∈ set evs5;
    Says C (CA i) (EXHcrypt KC1 EKi ⦃Agent C, Nonce NC2⦄ (Pan(pan C)))
        ∈ set evs5 |]
==> Says C (CA i)
         ⦃Crypt KC3
             ⦃Agent C, Nonce NC3, Key KC2, Key (pubSK C),
               Crypt (priSK C)
                 (Hash ⦃Agent C, Nonce NC3, Key KC2,
                         Key (pubSK C), Pan (pan C), Nonce CardSecret⦄)⦄,
           Crypt EKi ⦃Key KC3, Pan (pan C), Nonce CardSecret⦄ ⦄
    # Notes C ⦃Key KC2, Agent (CA i)⦄
    # Notes C ⦃Key KC3, Agent (CA i)⦄
    # evs5 ∈ set_cr"
```

— CertRes: CA responds sending NC3 back with its half of the secret value, its signature certificate and the new cardholder signature certificate. CA checks to have never certified the key proposed by C. NOTE: In Merchant Registration, the corresponding rule (4) uses the "sign" primitive. The encryption below is actually *EncK*, which is just *Crypt K (sign SK X)*.

```
| SET_CR6:
"[| evs6 ∈ set_cr;

4.7 Useful lemmas

Rewriting rule for private encryption keys. Analogous rewriting rules for other keys aren't needed.

```
lemma parts_image_priEK:
     "[|Key (priEK C) ∈ parts (Key`KK ∪ (knows Spy evs));
        evs ∈ set_cr|] ==> priEK C ∈ KK | C ∈ bad"
```
⟨proof⟩

trivial proof because (priEK C) never appears even in (parts evs)

```
lemma analz_image_priEK:
     "evs ∈ set_cr ==>
          (Key (priEK C) ∈ analz (Key`KK ∪ (knows Spy evs))) =
          (priEK C ∈ KK | C ∈ bad)"
```
⟨proof⟩

4.8 Secrecy of Session Keys

4.8.1 Lemmas about the predicate KeyCryptKey

A fresh DK cannot be associated with any other (with respect to a given trace).

```
lemma DK_fresh_not_KeyCryptKey:
     "[| Key DK ∉ used evs; evs ∈ set_cr |] ==> ¬ KeyCryptKey DK K evs"
```
⟨proof⟩

A fresh K cannot be associated with any other. The assumption that DK isn't a private encryption key may be an artifact of the particular definition of KeyCryptKey.

```
lemma K_fresh_not_KeyCryptKey:
     "[|∀C. DK ≠ priEK C; Key K ∉ used evs|] ==> ¬ KeyCryptKey DK K evs"
```
⟨proof⟩

This holds because if (priEK (CA i)) appears in any traffic then it must be known to the Spy, by `Spy_see_private_Key`

```
lemma cardSK_neq_priEK:
     "[|Key cardSK ∉ analz (knows Spy evs);
        Key cardSK ∈ parts (knows Spy evs);
        evs ∈ set_cr|] ==> cardSK ≠ priEK C"
```
⟨proof⟩

```
lemma not_KeyCryptKey_cardSK [rule_format (no_asm)]:
     "[|cardSK ∉ symKeys;  ∀C. cardSK ≠ priEK C;  evs ∈ set_cr|] ==>
      Key cardSK ∉ analz (knows Spy evs) ⟶ ¬ KeyCryptKey cardSK K evs"
⟨proof⟩
```

Lemma for message 5: pubSK C is never used to encrypt Keys.

```
lemma pubSK_not_KeyCryptKey [simp]: "¬ KeyCryptKey (pubSK C) K evs"
⟨proof⟩
```

Lemma for message 6: either cardSK is compromised (when we don't care) or else cardSK hasn't been used to encrypt K. Previously we treated message 5 in the same way, but the current model assumes that rule *SET_CR5* is executed only by honest agents.

```
lemma msg6_KeyCryptKey_disj:
     "[|Gets B {|Crypt KC3 {|Agent C, Nonce N, Key KC2, Key cardSK, X|}, Y|}
          ∈ set evs;
        cardSK ∉ symKeys;  evs ∈ set_cr|]
      ==> Key cardSK ∈ analz (knows Spy evs) |
          (∀K. ¬ KeyCryptKey cardSK K evs)"
⟨proof⟩
```

As usual: we express the property as a logical equivalence

```
lemma Key_analz_image_Key_lemma:
     "P ⟶ (Key K ∈ analz (Key`KK ∪ H)) ⟶ (K ∈ KK | Key K ∈ analz H)
      ==>
      P ⟶ (Key K ∈ analz (Key`KK ∪ H)) = (K ∈ KK | Key K ∈ analz H)"
⟨proof⟩

⟨ML⟩
```

The *(no_asm)* attribute is essential, since it retains the quantifier and allows the simprule's condition to itself be simplified.

```
lemma symKey_compromise [rule_format (no_asm)]:
     "evs ∈ set_cr ==>
      (∀SK KK. SK ∈ symKeys ⟶ (∀K ∈ KK. ¬ KeyCryptKey K SK evs)   ⟶
               (Key SK ∈ analz (Key`KK ∪ (knows Spy evs))) =
               (SK ∈ KK | Key SK ∈ analz (knows Spy evs)))"
⟨proof⟩
```

The remaining quantifiers seem to be essential. NO NEED to assume the cardholder's OK: bad cardholders don't do anything wrong!!

```
lemma symKey_secrecy [rule_format]:
     "[|CA i ∉ bad;  K ∈ symKeys;  evs ∈ set_cr|]
      ==> ∀X c. Says (Cardholder c) (CA i) X ∈ set evs ⟶
                Key K ∈ parts{X} ⟶
                Cardholder c ∉ bad ⟶
                Key K ∉ analz (knows Spy evs)"
⟨proof⟩
```

4.9 Primary Goals of Cardholder Registration

The cardholder's certificate really was created by the CA, provided the CA is uncompromised

Lemma concerning the actual signed message digest

```
lemma cert_valid_lemma:
     "[|Crypt (priSK (CA i)) {|Hash {|Nonce N, Pan(pan C)|}, Key cardSK, N1|}
          ∈ parts (knows Spy evs);
        CA i ∉ bad; evs ∈ set_cr|]
  ==> ∃KC2 X Y. Says (CA i) C
                     (Crypt KC2
                       {|X, certC (pan C) cardSK N onlySig (priSK (CA i)),
Y|})
                  ∈ set evs"
⟨proof⟩
```

Pre-packaged version for cardholder. We don't try to confirm the values of KC2, X and Y, since they are not important.

```
lemma certificate_valid_cardSK:
    "[|Gets C (Crypt KC2 {|X, certC (pan C) cardSK N onlySig (invKey SKi),
                              cert (CA i) SKi onlySig (priSK RCA)|}) ∈ set
evs;
        CA i ∉ bad; evs ∈ set_cr|]
  ==> ∃KC2 X Y. Says (CA i) C
                     (Crypt KC2
                       {|X, certC (pan C) cardSK N onlySig (priSK (CA i)),
Y|})
                   ∈ set evs"
⟨proof⟩
```

```
lemma Hash_imp_parts [rule_format]:
     "evs ∈ set_cr
      ==> Hash{|X, Nonce N|} ∈ parts (knows Spy evs) ⟶
          Nonce N ∈ parts (knows Spy evs)"
⟨proof⟩
```

```
lemma Hash_imp_parts2 [rule_format]:
     "evs ∈ set_cr
      ==> Hash{|X, Nonce M, Y, Nonce N|} ∈ parts (knows Spy evs) ⟶
          Nonce M ∈ parts (knows Spy evs) ∧ Nonce N ∈ parts (knows Spy evs)"
⟨proof⟩
```

4.10 Secrecy of Nonces

4.10.1 Lemmas about the predicate KeyCryptNonce

A fresh DK cannot be associated with any other (with respect to a given trace).

```
lemma DK_fresh_not_KeyCryptNonce:
     "[| DK ∈ symKeys; Key DK ∉ used evs; evs ∈ set_cr |]
      ==> ¬ KeyCryptNonce DK K evs"
⟨proof⟩
```

A fresh N cannot be associated with any other (with respect to a given trace).

```
lemma N_fresh_not_KeyCryptNonce:
     "∀C. DK ≠ priEK C ==> Nonce N ∉ used evs ⟶ ¬ KeyCryptNonce DK N evs"
⟨proof⟩
```

lemma *not_KeyCryptNonce_cardSK [rule_format (no_asm)]:*
```
"[|cardSK ∉ symKeys;  ∀C. cardSK ≠ priEK C;  evs ∈ set_cr|] ==>
 Key cardSK ∉ analz (knows Spy evs) ⟶ ¬ KeyCryptNonce cardSK N evs"
```
⟨*proof*⟩

4.10.2 Lemmas for message 5 and 6: either cardSK is compromised (when we don't care) or else cardSK hasn't been used to encrypt K.

Lemma for message 5: pubSK C is never used to encrypt Nonces.

lemma *pubSK_not_KeyCryptNonce [simp]: "¬ KeyCryptNonce (pubSK C) N evs"*
⟨*proof*⟩

Lemma for message 6: either cardSK is compromised (when we don't care) or else cardSK hasn't been used to encrypt K.

lemma *msg6_KeyCryptNonce_disj:*
```
"[|Gets B {|Crypt KC3 {|Agent C, Nonce N, Key KC2, Key cardSK, X|}, Y|}
     ∈ set evs;
   cardSK ∉ symKeys;  evs ∈ set_cr|]
 ==> Key cardSK ∈ analz (knows Spy evs) |
     ((∀K. ¬ KeyCryptKey cardSK K evs) ∧
      (∀N. ¬ KeyCryptNonce cardSK N evs))"
```
⟨*proof*⟩

As usual: we express the property as a logical equivalence

lemma *Nonce_analz_image_Key_lemma:*
```
"P ⟶ (Nonce N ∈ analz (Key`KK ∪ H)) ⟶ (Nonce N ∈ analz H)
 ==> P ⟶ (Nonce N ∈ analz (Key`KK ∪ H)) = (Nonce N ∈ analz H)"
```
⟨*proof*⟩

The *(no_asm)* attribute is essential, since it retains the quantifier and allows the simprule's condition to itself be simplified.

lemma *Nonce_compromise [rule_format (no_asm)]:*
```
"evs ∈ set_cr ==>
 (∀N KK. (∀K ∈ KK. ¬ KeyCryptNonce K N evs)   ⟶
          (Nonce N ∈ analz (Key`KK ∪ (knows Spy evs))) =
          (Nonce N ∈ analz (knows Spy evs)))"
```
⟨*proof*⟩

4.11 Secrecy of CardSecret: the Cardholder's secret

lemma *NC2_not_CardSecret:*

                  cert (CA i) SKi onlySig (priSK RCA)|} ∈ set evs;
       KC2 ∈ symKeys;  evs ∈ set_cr|]
     ==> Nonce NonceCCA ∉ analz (knows Spy evs)"
```
⟨proof⟩

We don't bother to prove guarantees for the CA. He doesn't care about the PANSecret: it isn't his credit card!

4.13 Rewriting Rule for PANs

Lemma for message 6: either cardSK isn't a CA's private encryption key, or if it is then (because it appears in traffic) that CA is bad, and so the Spy knows that key already. Either way, we can simplify the expression `analz (insert (Key cardSK) X)`.

lemma *msg6_cardSK_disj:*
```
    "[|Gets A {|Crypt K {|c, n, k', Key cardSK, X|}, Y|}
          ∈ set evs;  evs ∈ set_cr |]
     ==> cardSK ∉ range(invKey o pubEK o CA) | Key cardSK ∈ knows Spy evs"
```
⟨proof⟩

lemma *analz_image_pan_lemma:*
```
    "(Pan P ∈ analz (Key`nE ∪ H)) ⟶ (Pan P ∈ analz H)  ==>
     (Pan P ∈ analz (Key`nE ∪ H)) =   (Pan P ∈ analz H)"
```
⟨proof⟩

lemma *analz_image_pan [rule_format]:*
```
    "evs ∈ set_cr ==>
      ∀KK. KK ⊆ - invKey ` pubEK ` range CA ⟶
           (Pan P ∈ analz (Key`KK ∪ (knows Spy evs))) =
           (Pan P ∈ analz (knows Spy evs))"
```
⟨proof⟩

lemma *analz_insert_pan:*
```
    "[| evs ∈ set_cr;  K ∉ invKey ` pubEK ` range CA |] ==>
         (Pan P ∈ analz (insert (Key K) (knows Spy evs))) =
         (Pan P ∈ analz (knows Spy evs))"
```
⟨proof⟩

Confidentiality of the PAN. Maybe we could combine the statements of this

theorem with *analz_image_pan*, requiring a single induction but a much more difficult proof.

```
lemma pan_confidentiality:
     "[| Pan (pan C) ∈ analz(knows Spy evs); C ≠Spy; evs ∈ set_cr|]
    ==> ∃i X K HN.
        Says C (CA i) {|X, Crypt (pubEK (CA i)) {|Key K, Pan (pan C), HN|} |}
           ∈ set evs
      ∧ (CA i) ∈ bad"
⟨proof⟩
```

4.14 Unicity

```
lemma CR6_Says_imp_Notes:
     "[|Says (CA i) C (Crypt KC2
          {|sign (priSK (CA i)) {|Agent C, Nonce NC3, Agent (CA i), Nonce Y|},
            certC (pan C) cardSK X onlySig (priSK (CA i)),
            cert (CA i) (pubSK (CA i)) onlySig (priSK RCA)|})  ∈ set evs;
        evs ∈ set_cr |]
      ==> Notes (CA i) (Key cardSK) ∈ set evs"
⟨proof⟩
```

Unicity of cardSK: it uniquely identifies the other components. This holds because a CA accepts a cardSK at most once.

```
lemma cardholder_key_unicity:
     "[|Says (CA i) C (Crypt KC2
          {|sign (priSK (CA i)) {|Agent C, Nonce NC3, Agent (CA i), Nonce Y|},
            certC (pan C) cardSK X onlySig (priSK (CA i)),
            cert (CA i) (pubSK (CA i)) onlySig (priSK RCA)|})
          ∈ set evs;
        Says (CA i) C' (Crypt KC2'
          {|sign (priSK (CA i)) {|Agent C', Nonce NC3', Agent (CA i), Nonce
Y'|},
            certC (pan C') cardSK X' onlySig (priSK (CA i)),
            cert (CA i) (pubSK (CA i)) onlySig (priSK RCA)|})
          ∈ set evs;
        evs ∈ set_cr |] ==> C=C' ∧ NC3=NC3' ∧ X=X' ∧ KC2=KC2' ∧ Y=Y'"
⟨proof⟩⟨proof⟩⟨proof⟩
```

Cannot show cardSK to be secret because it isn't assumed to be fresh it could be a previously compromised cardSK [e.g. involving a bad CA]

end

5 The SET Merchant Registration Protocol

theory *Merchant_Registration*
imports *Public_SET*
begin

Copmpared with Cardholder Reigstration, *KeyCryptKey* is not needed: no session key encrypts another. Instead we prove the "key compromise" theorems for sets KK that contain no private encryption keys (*priEK C*).

inductive_set

```
  set_mr :: "event list set"
where
```

```
  Nil:     — Initial trace is empty
          "[] ∈ set_mr"
```

```
| Fake:    — The spy MAY say anything he CAN say.
          "[| evsf ∈ set_mr; X ∈ synth (analz (knows Spy evsf)) |]
           ==> Says Spy B X  # evsf ∈ set_mr"
```

```
| Reception: — If A sends a message X to B, then B might receive it
             "[| evsr ∈ set_mr; Says A B X ∈ set evsr |]
              ==> Gets B X  # evsr ∈ set_mr"
```

```
| SET_MR1: — RegFormReq: M requires a registration form to a CA
          "[| evs1 ∈ set_mr; M = Merchant k; Nonce NM1 ∉ used evs1 |]
           ==> Says M (CA i) {|Agent M, Nonce NM1|} # evs1 ∈ set_mr"
```

| SET_MR2: — RegFormRes: CA replies with the registration form and the certificates for her keys

```
  "[| evs2 ∈ set_mr; Nonce NCA ∉ used evs2;
      Gets (CA i) {|Agent M, Nonce NM1|} ∈ set evs2 |]
   ==> Says (CA i) M {|sign (priSK (CA i)) {|Agent M, Nonce NM1, Nonce NCA|},
                      cert (CA i) (pubEK (CA i)) onlyEnc (priSK RCA),
                      cert (CA i) (pubSK (CA i)) onlySig (priSK RCA) |}
         # evs2 ∈ set_mr"
```

| SET_MR3:

— CertReq: M submits the key pair to be certified. The Notes event allows KM1 to be lost if M is compromised. Piero remarks that the agent mentioned inside the signature is not verified to correspond to M. As in CR, each Merchant has fixed key pairs. M is only optionally required to send NCA back, so M doesn't do so in the model

```
  "[| evs3 ∈ set_mr; M = Merchant k; Nonce NM2 ∉ used evs3;
      Key KM1 ∉ used evs3;  KM1 ∈ symKeys;
      Gets M {|sign (invKey SKi) {|Agent X, Nonce NM1, Nonce NCA|},

          ∈ parts (knows Spy evs);
        CA i ∉ bad;  CA i ≠ RCA;  evs ∈ set_mr|]
 ==> ∃X Y Z. Says (CA i) M
                 {|X, Y, cert M merEK onlyEnc (priSK (CA i)), Z|} ∈ set evs"
```
⟨proof⟩

lemma *certificate_merEK_valid:*
```
     "[| cert M merEK onlyEnc (priSK (CA i)) ∈ parts (knows Spy evs);
         CA i ∉ bad;  CA i ≠ RCA;  evs ∈ set_mr|]
 ==> ∃X Y Z. Says (CA i) M
                 {|X, Y, cert M merEK onlyEnc (priSK (CA i)), Z|} ∈ set evs"
```
⟨proof⟩

The two certificates - for merSK and for merEK - cannot be proved to have originated together

end

6 Purchase Phase of SET

theory *Purchase*
imports *Public_SET*
begin

Note: nonces seem to consist of 20 bytes. That includes both freshness challenges (Chall-EE, etc.) and important secrets (CardSecret, PANsecret)

This version omits *LID_C* but retains *LID_M*. At first glance (Programmer's Guide page 267) it seems that both numbers are just introduced for the respective convenience of the Cardholder's and Merchant's system. However, omitting both of them would create a problem of identification: how can the Merchant's system know what transaction is it supposed to process?

Further reading (Programmer's guide page 309) suggest that there is an outside bootstrapping message (SET initiation message) which is used by the Merchant and the Cardholder to agree on the actual transaction. This bootstrapping message is described in the SET External Interface Guide and ought to generate *LID_M*. According SET Extern Interface Guide, this number might be a cookie, an invoice number etc. The Programmer's Guide on page 310, states that in absence of *LID_M* the protocol must somehow ("outside SET") identify the transaction from OrderDesc, which is assumed to be a searchable text only field. Thus, it is assumed that the Merchant or the Cardholder somehow agreed out-of-bad on the value of *LID_M* (for instance a cookie in a web transaction etc.). This out-of-band agreement is expressed with a preliminary start action in which the merchant and the Cardholder agree on the appropriate values. Agreed values are stored with a suitable notes action.

"XID is a transaction ID that is usually generated by the Merchant system, unless there is no PInitRes, in which case it is generated by the Cardholder system. It is a randomly generated 20 byte variable that is globally unique (statistically). Merchant and Cardholder systems shall use appropriate random number generators to ensure the global uniqueness of XID." –Programmer's Guide, page 267.

PI (Payment Instruction) is the most central and sensitive data structure in SET. It is used to pass the data required to authorize a payment card payment from the Cardholder to the Payment Gateway, which will use the data to initiate a payment card transaction through the traditional payment card financial network. The data is encrypted by the Cardholder and sent via the Merchant, such that the data is hidden from the Merchant unless the Acquirer passes the data back to the Merchant. –Programmer's Guide, page 271.

consts

CardSecret :: "nat ⇒ nat"
— Maps Cardholders to CardSecrets. A CardSecret of 0 means no cerificate, must use unsigned format.

PANSecret :: "nat ⇒ nat"
— Maps Cardholders to PANSecrets.

```
inductive_set
  set_pur :: "event list set"

              "[| evsr ∈ set_pur;  Says A B X ∈ set evsr |]
               ==> Gets B X  # evsr ∈ set_pur"

| Start:
```

— Added start event which is out-of-band for SET: the Cardholder and the merchant agree on the amounts and uses *LID_M* as an identifier. This is suggested by the External Interface Guide. The Programmer's Guide, in absence of *LID_M*, states that the merchant uniquely identifies the order out of some data contained in OrderDesc.

```
   "[|evsStart ∈ set_pur;
      Number LID_M ∉ used evsStart;

```
    "[|Crypt K X ∈ analz (knows Spy evs);
       K ∈ symKeys; evs ∈ set_pur |] ==> Key K ∈ used evs"
```
⟨proof⟩

New versions: as above, but generalized to have the KK argument

lemma *gen_new_keys_not_used:*
```
    "[|Key K ∉ used evs; K ∈ symKeys; evs ∈ set_pur |]
     ==> Key K ∉ used evs ⟶ K ∈ symKeys ⟶
         K ∉ keysFor (parts (Key`KK ∪ knows Spy evs))"
```
⟨proof⟩

lemma *gen_new_keys_not_analzd:*
```
    "[|Key K ∉ used evs; K ∈ symKeys; evs ∈ set_pur |]
     ==> K ∉ keysFor (analz (Key`KK ∪ knows Spy evs))"
```
⟨proof⟩

lemma *analz_Key_image_insert_eq:*
```
    "[|Key K ∉ used evs; K ∈ symKeys; evs ∈ set_pur |]
     ==> analz (Key ` (insert K KK) ∪ knows Spy evs) =
         insert (Key K) (analz (Key ` KK ∪ knows Spy evs))"
```
⟨proof⟩

6.5 Secrecy of Symmetric Keys

lemma *Key_analz_image_Key_lemma:*
```
    "P ⟶ (Key K ∈ analz (Key`KK ∪ H)) ⟶ (K∈KK | Key K ∈ analz H)
     ==>
     P ⟶ (Key K ∈ analz (Key`KK ∪ H)) = (K∈KK | Key K ∈ analz H)"
```
⟨proof⟩

lemma *symKey_compromise:*
```
    "evs ∈ set_pur ⟹
     (∀SK KK. SK ∈ symKeys ⟶
       (∀K ∈ KK. K ∉ range(λC. priEK C)) ⟶
            (Key SK ∈ analz (Key`KK ∪ (knows Spy evs))) =
            (SK ∈ KK ∨ Key SK ∈ analz (knows Spy evs)))"
```
⟨proof⟩

6.6 Secrecy of Nonces

As usual: we express the property as a logical equivalence

```
lemma Nonce_analz_image_Key_lemma:
     "P ⟶ (Nonce N ∈ analz (Key`KK ∪ H)) ⟶ (Nonce N ∈ analz H)
      ==> P ⟶ (Nonce N ∈ analz (Key`KK ∪ H)) = (Nonce N ∈ analz H)"
⟨proof⟩
```

The `(no_asm)` attribute is essential, since it retains the quantifier and allows the simprule's condition to itself be simplified.

```
lemma Nonce_compromise [rule_format (no_asm)]:
     "evs ∈ set_pur ==>
      (∀N KK. (∀K ∈ KK. K ∉ range(λC. priEK C))   ⟶
              (Nonce N ∈ analz (Key`KK ∪ (knows Spy evs))) =
              (Nonce N ∈ analz (knows Spy evs)))"
⟨proof⟩

lemma PANSecret_notin_spies:
     "[|Nonce (PANSecret k) ∈ analz (knows Spy evs);  evs ∈ set_pur|]
      ==>
       (∃V W X Y KC2 M. ∃P ∈ bad.
          Says (Cardholder k) M
               {|{|W, EXcrypt KC2 (pubEK P) X {|Y, Nonce (PANSecret k)|}|},
                 V|}  ∈  set evs)"
⟨proof⟩
```

This theorem is a bit silly, in that many CardSecrets are 0! But then we don't care. NOT USED

```
lemma CardSecret_notin_spies:
     "evs ∈ set_pur ==> Nonce (CardSecret i) ∉ parts (knows Spy evs)"
⟨proof⟩
```

6.7 Confidentiality of PAN

```
lemma analz_image_pan_lemma:
     "(Pan P ∈ analz (Key`nE ∪ H)) ⟶ (Pan P ∈ analz H)  ==>
      (Pan P ∈ analz (Key`nE ∪ H)) =   (Pan P ∈ analz H)"
⟨proof⟩
```

The `(no_asm)` attribute is essential, since it retains the quantifier and allows the simprule's condition to itself be simplified.

```
lemma analz_image_pan [rule_format (no_asm)]:
     "evs ∈ set_pur ==>
       ∀KK. (∀K ∈ KK. K ∉ range(λC. priEK C)) ⟶
            (Pan P ∈ analz (Key`KK ∪ (knows Spy evs))) =
            (Pan P ∈ analz (knows Spy evs))"
⟨proof⟩

lemma analz_insert_pan:
     "[| evs ∈ set_pur;  K ∉ range(λC. priEK C) |] ==>
          (Pan P ∈ analz (insert (Key K) (knows Spy evs))) =
          (Pan P ∈ analz (knows Spy evs))"
⟨proof⟩
```

Confidentiality of the PAN, unsigned case.

```
theorem pan_confidentiality_unsigned:
     "[| Pan (pan C) ∈ analz(knows Spy evs);  C = Cardholder k;
         CardSecret k = 0;  evs ∈ set_pur|]
    ==> ∃P M KC1 K X Y.
     Says C M {|EXHcrypt KC1 (pubEK P) X (Pan (pan C)), Y|}
          ∈ set evs  ∧
     P ∈ bad"
⟨proof⟩
```

Confidentiality of the PAN, signed case.

```
theorem pan_confidentiality_signed:
 "[|Pan (pan C) ∈ analz(knows Spy evs);  C = Cardholder k;
    CardSecret k ≠ 0;  evs ∈ set_pur|]
  ==> ∃P M KC2 PIDualSign_1 PIDualSign_2 other OIDualSign.
      Says C M {|{|PIDualSign_1,
                   EXcrypt KC2 (pubEK P) PIDualSign_2 {|Pan (pan C), other|}|},

       OIDualSign|} ∈ set evs  ∧  P ∈ bad"
⟨proof⟩
```

General goal: that C, M and PG agree on those details of the transaction that they are allowed to know about. PG knows about price and account details. M knows about the order description and price. C knows both.

6.8 Proofs Common to Signed and Unsigned Versions

```
lemma M_Notes_PG:
     "[|Notes M {|Number LID_M, Agent P, Agent M, Agent C, etc|} ∈ set evs;
        evs ∈ set_pur|] ==> ∃j. P = PG j"
⟨proof⟩
```

If we trust M, then `LID_M` determines his choice of P (Payment Gateway)

```
lemma goodM_gives_correct_PG:
     "[| MsgPInitRes =
            {|Number LID_M, xid, cc, cm, cert P EKj onlyEnc (priSK RCA)|};

         evs ∈ set_pur; M ∉ bad |]
      ==> ∃j trans.
            P = PG j ∧
            Notes M {|Number LID_M, Agent P, trans|} ∈ set evs"
⟨proof⟩
```

```
lemma C_gets_correct_PG:
     "[| Gets A (sign (priSK M) {|Number LID_M, xid, cc, cm,
                              cert P EKj onlyEnc (priSK RCA)|}) ∈ set evs;
         evs ∈ set_pur;  M ∉ bad|]
      ==> ∃j trans.
            P = PG j ∧
            Notes M {|Number LID_M, Agent P, trans|} ∈ set evs ∧
            EKj = pubEK P"
⟨proof⟩
```

When C receives PInitRes, he learns M's choice of P

lemma *C_verifies_PInitRes:*
```
 "[| MsgPInitRes = {|Number LID_M, Number XID, Nonce Chall_C, Nonce Chall_M,
           cert P EKj onlyEnc (priSK RCA)|};
     Crypt (priSK M) (Hash MsgPInitRes) ∈ parts (knows Spy evs);
     evs ∈ set_pur;  M ∉ bad|]
  ==> ∃j trans.
         Notes M {|Number LID_M, Agent P, trans|} ∈ set evs ∧
         P = PG j ∧
         EKj = pubEK P"
```
⟨*proof*⟩

Corollary of previous one

lemma *Says_C_PInitRes:*
```
     "[|Says A C (sign (priSK M)
                      {|Number LID_M, Number XID,
                        Nonce Chall_C, Nonce Chall_M,
                        cert P EKj onlyEnc (priSK RCA)|})
           ∈ set evs;  M ∉ bad;  evs ∈ set_pur|]
      ==> ∃j trans.
           Notes M {|Number LID_M, Agent P, trans|} ∈ set evs ∧
           P = PG j ∧
           EKj = pubEK (PG j)"
```
⟨*proof*⟩

When P receives an AuthReq, he knows that the signed part originated with M. PIRes also has a signed message from M....

lemma *P_verifies_AuthReq:*
```
     "[| AuthReqData = {|Number LID_M, Number XID, HOIData, HOD|};
         Crypt (priSK M) (Hash {|AuthReqData, Hash P_I|})
           ∈ parts (knows Spy evs);
         evs ∈ set_pur;  M ∉ bad|]
      ==> ∃j trans KM OIData HPIData.
            Notes M {|Number LID_M, Agent (PG j), trans|} ∈ set evs ∧
            Gets M {|P_I, OIData, HPIData|} ∈ set evs ∧
            Says M (PG j) (EncB (priSK M) KM (pubEK (PG j)) AuthReqData P_I)
              ∈ set evs"
```
⟨*proof*⟩

When M receives AuthRes, he knows that P signed it, including the identifying tags and the purchase amount, which he can verify. (Although the spec has SIGNED and UNSIGNED forms of AuthRes, they send the same message to M.) The conclusion is weak: M is existentially quantified! That is because Authorization Response does not refer to M, while the digital envelope weakens the link between *MsgAuthRes* and *priSK M*. Changing the precondition to refer to *Crypt K (sign SK M)* requires assuming *K* to be secure, since otherwise the Spy could create that message.

theorem *M_verifies_AuthRes:*
```
  "[| MsgAuthRes = {|{|Number LID_M, Number XID, Number PurchAmt|},
                   Hash authCode|};
      Crypt (priSK (PG j)) (Hash MsgAuthRes) ∈ parts (knows Spy evs);
      PG j ∉ bad;  evs ∈ set_pur|]
```

```
  ==> ∃M KM KP HOIData HOD P_I.
        Gets (PG j)
           (EncB (priSK M) KM (pubEK (PG j))
                    {|Number LID_M, Number XID, HOIData, HOD|}
                    P_I) ∈ set evs ∧
        Says (PG j) M
             (EncB (priSK (PG j)) KP (pubEK M)
              {|Number LID_M, Number XID, Number PurchAmt|}
              authCode) ∈ set evs"
```
⟨proof⟩

6.9 Proofs for Unsigned Purchases

What we can derive from the ASSUMPTION that C issued a purchase request. In the unsigned case, we must trust "C": there's no authentication.

lemma *C_determines_EKj:*
```
     "[| Says C M {|EXHcrypt KC1 EKj {|PIHead, Hash OIData|} (Pan (pan C)),
                    OIData, Hash{|PIHead, Pan (pan C)|} |} ∈ set evs;
         PIHead = {|Number LID_M, Trans_details|};
         evs ∈ set_pur;  C = Cardholder k;  M ∉ bad|]
  ==> ∃trans j.
               Notes M {|Number LID_M, Agent (PG j), trans |} ∈ set evs ∧
               EKj = pubEK (PG j)"
```
⟨proof⟩

Unicity of *LID_M* between Merchant and Cardholder notes

lemma *unique_LID_M:*
```
     "[|Notes (Merchant i) {|Number LID_M, Agent P, Trans|} ∈ set evs;
        Notes C {|Number LID_M, Agent M, Agent C, Number OD,
             Number PA|} ∈ set evs;
        evs ∈ set_pur|]
      ==> M = Merchant i ∧ Trans = {|Agent M, Agent C, Number OD, Number PA|}"
```
⟨proof⟩

Unicity of *LID_M*, for two Merchant Notes events

lemma *unique_LID_M2:*
```
     "[|Notes M {|Number LID_M, Trans|} ∈ set evs;
        Notes M {|Number LID_M, Trans'|} ∈ set evs;
        evs ∈ set_pur|] ==> Trans' = Trans"
```
⟨proof⟩

Lemma needed below: for the case that if PRes is present, then *LID_M* has been used.

lemma *signed_imp_used:*
```
     "[| Crypt (priSK M) (Hash X) ∈ parts (knows Spy evs);
         M ∉ bad;  evs ∈ set_pur|] ==> parts {X} ⊆ used evs"
```
⟨proof⟩

Similar, with nested Hash

lemma *signed_Hash_imp_used:*
```
     "[| Crypt (priSK C) (Hash {|H, Hash X|}) ∈ parts (knows Spy evs);
         C ∉ bad;  evs ∈ set_pur|] ==> parts {X} ⊆ used evs"
```

⟨*proof*⟩

Lemma needed below: for the case that if PRes is present, then `LID_M` has been used.

lemma *PRes_imp_LID_used:*
```
"[| Crypt (priSK M) (Hash {|N, X|}) ∈ parts (knows Spy evs);
    M ∉ bad;  evs ∈ set_pur|] ==> N ∈ used evs"
```
⟨*proof*⟩

When C receives PRes, he knows that M and P agreed to the purchase details. He also knows that P is the same PG as before

lemma *C_verifies_PRes_lemma:*
```
"[| Crypt (priSK M) (Hash MsgPRes) ∈ parts (knows Spy evs);
    Notes C {|Number LID_M, Trans |} ∈ set evs;
    Trans = {| Agent M, Agent C, Number OrderDesc, Number PurchAmt |};
    MsgPRes = {|Number LID_M, Number XID, Nonce Chall_C,
           Hash (Number PurchAmt)|};
    evs ∈ set_pur;  M ∉ bad|]
 ==> ∃j KP.
      Notes M {|Number LID_M, Agent (PG j), Trans |}
        ∈ set evs ∧
      Gets M (EncB (priSK (PG j)) KP (pubEK M)
              {|Number LID_M, Number XID, Number PurchAmt|}
              authCode)
        ∈ set evs ∧
      Says M C (sign (priSK M) MsgPRes) ∈ set evs"
```
⟨*proof*⟩

When the Cardholder receives Purchase Response from an uncompromised Merchant, he knows that M sent it. He also knows that M received a message signed by a Payment Gateway chosen by M to authorize the purchase.

theorem *C_verifies_PRes:*
```
"[| MsgPRes = {|Number LID_M, Number XID, Nonce Chall_C,
               Hash (Number PurchAmt)|};
    Gets C (sign (priSK M) MsgPRes) ∈ set evs;
    Notes C {|Number LID_M, Agent M, Agent C, Number OrderDesc,
              Number PurchAmt|} ∈ set evs;
    evs ∈ set_pur;  M ∉ bad|]
 ==> ∃P KP trans.
      Notes M {|Number LID_M,Agent P, trans|} ∈ set evs ∧
      Gets M (EncB (priSK P) KP (pubEK M)
              {|Number LID_M, Number XID, Number PurchAmt|}
              authCode)  ∈  set evs ∧
      Says M C (sign (priSK M) MsgPRes) ∈ set evs"
```
⟨*proof*⟩

6.10 Proofs for Signed Purchases

Some Useful Lemmas: the cardholder knows what he is doing

lemma *Crypt_imp_Says_Cardholder:*
```
"[| Crypt K {|{|{|Number LID_M, others|}, Hash OIData|}, Hash PANData|}
      ∈ parts (knows Spy evs);
```

```
        PANData = {|Pan (pan (Cardholder k)), Nonce (PANSecret k)|};
        Key K ∉ analz (knows Spy evs);
        evs ∈ set_pur|]
  ==> ∃M shash EK HPIData.
       Says (Cardholder k) M {|{|shash,
         Crypt K
           {|{|{|Number LID_M, others|}, Hash OIData|}, Hash PANData|},
          Crypt EK {|Key K, PANData|}|},
         OIData, HPIData|} ∈ set evs"
```
⟨*proof*⟩

lemma *Says_PReqS_imp_trans_details_C:*

```
     "[| MsgPReqS = {|{|shash,
                 Crypt K
                  {|{|{|Number LID_M, PIrest|}, Hash OIData|}, hashpd|},
              cryptek|}, data|};
         Says (Cardholder k) M MsgPReqS ∈ set evs;
         evs ∈ set_pur |]
   ==> ∃trans.
           Notes (Cardholder k)
                 {|Number LID_M, Agent M, Agent (Cardholder k), trans|}
            ∈ set evs"
```
⟨*proof*⟩

Can't happen: only Merchants create this type of Note

lemma *Notes_Cardholder_self_False:*

```
     "[|Notes (Cardholder k)
          {|Number n, Agent P, Agent (Cardholder k), Agent C, etc|} ∈ set evs;
        evs ∈ set_pur|] ==> False"
```
⟨*proof*⟩

When M sees a dual signature, he knows that it originated with C. Using XID he knows it was intended for him. This guarantee isn't useful to P, who never gets OIData.

theorem *M_verifies_Signed_PReq:*

```
 "[| MsgDualSign = {|HPIData, Hash OIData|};
     OIData = {|Number LID_M, etc|};
     Crypt (priSK C) (Hash MsgDualSign) ∈ parts (knows Spy evs);
     Notes M {|Number LID_M, Agent P, extras|} ∈ set evs;
     M = Merchant i;  C = Cardholder k;  C ∉ bad;  evs ∈ set_pur|]
  ==> ∃PIData PICrypt.
        HPIData = Hash PIData ∧
        Says C M {|{|sign (priSK C) MsgDualSign, PICrypt|}, OIData, Hash PIData|}
          ∈ set evs"
```
⟨*proof*⟩

When P sees a dual signature, he knows that it originated with C. and was intended for M. This guarantee isn't useful to M, who never gets PIData. I don't see how to link `PG j` and `LID_M` without assuming `M ∉ bad`.

theorem *P_verifies_Signed_PReq:*

```
     "[| MsgDualSign = {|Hash PIData, HOIData|};
         PIData = {|PIHead, PANData|};
         PIHead = {|Number LID_M, Number XID, HOD, Number PurchAmt, Agent M,
```

```
                 TransStain⦄;
          Crypt (priSK C) (Hash MsgDualSign) ∈ parts (knows Spy evs);
          evs ∈ set_pur;  C ∉ bad;  M ∉ bad|]
    ==> ∃OIData OrderDesc K j trans.
           HOD = Hash⦃Number OrderDesc, Number PurchAmt⦄ ∧
           HOIData = Hash OIData ∧
           Notes M ⦃Number LID_M, Agent (PG j), trans⦄ ∈ set evs ∧
           Says C M ⦃⦃sign (priSK C) MsgDualSign,
                      EXcrypt K (pubEK (PG j))
                                 ⦃PIHead, Hash OIData⦄ PANData⦄,
                      OIData, Hash PIData⦄
             ∈ set evs"
```
⟨proof⟩

lemma *C_determines_EKj_signed:*
```
     "[| Says C M ⦃⦃sign (priSK C) text,
                     EXcrypt K EKj ⦃PIHead, X⦄ Y⦄, Z⦄ ∈ set evs;
         PIHead = ⦃Number LID_M, Number XID, W⦄;
         C = Cardholder k;  evs ∈ set_pur;  M ∉ bad|]
  ==> ∃ trans j.
         Notes M ⦃Number LID_M, Agent (PG j), trans⦄ ∈ set evs ∧
         EKj = pubEK (PG j)"
```
⟨proof⟩

lemma *M_Says_AuthReq:*
```
     "[| AuthReqData = ⦃Number LID_M, Number XID, HOIData, HOD⦄;
         sign (priSK M) ⦃AuthReqData, Hash P_I⦄ ∈ parts (knows Spy evs);
         evs ∈ set_pur;  M ∉ bad|]
   ==> ∃j trans KM.
           Notes M ⦃Number LID_M, Agent (PG j), trans ⦄ ∈ set evs ∧
             Says M (PG j)
               (EncB (priSK M) KM (pubEK (PG j)) AuthReqData P_I)
              ∈ set evs"
```
⟨proof⟩

A variant of *M_verifies_Signed_PReq* with explicit PI information. Even here we cannot be certain about what C sent to M, since a bad PG could have replaced the two key fields. (NOT USED)

lemma *Signed_PReq_imp_Says_Cardholder:*
```
     "[| MsgDualSign = ⦃Hash PIData, Hash OIData⦄;
         OIData = ⦃Number LID_M, Number XID, Nonce Chall_C, HOD, etc⦄;
         PIHead = ⦃Number LID_M, Number XID, HOD, Number PurchAmt, Agent M,
                    TransStain⦄;
         PIData = ⦃PIHead, PANData⦄;
         Crypt (priSK C) (Hash MsgDualSign) ∈ parts (knows Spy evs);
         M = Merchant i;  C = Cardholder k;  C ∉ bad;  evs ∈ set_pur|]
      ==> ∃KC EKj.
           Says C M ⦃⦃sign (priSK C) MsgDualSign,
                      EXcrypt KC EKj ⦃PIHead, Hash OIData⦄ PANData⦄,
                      OIData, Hash PIData⦄
              ∈ set evs"
```
⟨proof⟩

When P receives an AuthReq and a dual signature, he knows that C and M

agree on the essential details. PurchAmt however is never sent by M to P; instead C and M both send *HOD = Hash {|Number OrderDesc, Number PurchAmt|}* and P compares the two copies of HOD.

Agreement can't be proved for some things, including the symmetric keys used in the digital envelopes. On the other hand, M knows the true identity of PG (namely j'), and sends AReq there; he can't, however, check that the EXcrypt involves the correct PG's key.

```
theorem P_sees_CM_agreement:
     "[| AuthReqData = {|Number LID_M, Number XID, HOIData, HOD|};
         KC ∈ symKeys;
         Gets (PG j) (EncB (priSK M) KM (pubEK (PG j)) AuthReqData P_I)
           ∈ set evs;
